

Formulas, Citations and Placeholder Robustness

The attention score is computed as $\text{softmax}(\mathbf{QK}^T / \sqrt{d_k}) \mathbf{V}$, and the loss $L = -\sum(y \log(y_{\text{hat}}))$ is minimized during training. Prior studies [1][2][12] report $p < 0.05$ significance. The dataset is available at <https://doi.org/10.1000/fake-doi> and <https://example.com/dataset>. As shown in {v1}, the styled segment <style id='1'>keeps markup</style> intact. Contact: author@example.com. Code returns exit code %d with %s format strings.
